CASE STUDY

SANTYL Ointment is indicated for debriding chronic dermal ulcers and severely burned areas. Use of SANTYL Ointment should be terminated when debridement is complete and granulation tissue is well established. One case of systemic hypersensitivity has been reported after 1 year of treatment with collagenase and cortisone. Occasional slight transient erythema has been noted in surrounding tissue when applied outside the wound.

Please see accompanying complete Prescribing Information.

Chemical burn to thigh

Patient

22-year-old male

Wound type

Burn

History

History of tobacco use, but otherwise in good health

Wound presentation

The patient presented to the Outpatient Burn Wound Care Center with a chemical burn to the right thigh. Patient was initially seen at Workers’ Compensation Clinic where wound was irrigated for 15 minutes.
Cases of systemic hypersensitivity have been reported after 1 year of treatment with collagenase and cortisone. Occasional slight transient erythema has been noted in surrounding tissue when applied outside of the wound.
