CASE STUDY

SANTYL Ointment is indicated for debriding chronic dermal ulcers and severely burned areas. Use of SANTYL Ointment should be terminated when debridement is complete and granulation tissue is well established.

One case of systemic hypersensitivity has been reported after 1 year of treatment with collagenase and cortisone. Occasional slight transient erythema has been noted in surrounding tissue when applied outside the wound.

Please see accompanying complete Prescribing Information.

Diabetic ulcer on foot

Patient
89-year-old Caucasian male

Wound type
Diabetic foot ulcer

History
Non–insulin-dependent diabetes mellitus (NIDDM)

Wound presentation
• Ulcer on medial right hallux interphalangeal joint, noticed four days prior to first visit
• Seen by a primary care physician who prescribed an oral antibiotic
• Patient was applying Neosporin™ and a small adhesive bandage daily

SANTYL Ointment is indicated for debriding chronic dermal ulcers and severely burned areas.
Use of SANTYL Ointment should be terminated when debridement is complete and granulation tissue is well established.
One case of systemic hypersensitivity has been reported after 1 year of treatment with collagenase and cortisone. Occasional slight transient erythema has been noted in surrounding tissue when applied outside the wound.
Please see accompanying complete Prescribing Information.
**Treatment**

- Sharp debridement was performed at each visit
- Patient was instructed to wash and dry the wound daily
- Collagenase SANTYL® Ointment was prescribed to be applied daily for debridement of necrotic tissue
- Dry gauze was applied because the ulcer had enough drainage to supply appropriate moisture balance

*Individual results will vary*

---

**Result**

Complete debridement achieved within 4 weeks*

*Individual results will vary*

---
